

Training a Mouse Transfer Function using Reinforcement Learning

(Niels)

- A transfer function translates mouse movement into pointer movement
- All OS have their non-linear own transfer function that simply map physical speed to pointer speed [1]
- Unclear how the optimal transfer function looks like
- Reinforcement learning [2] enables to learn functions without paired data

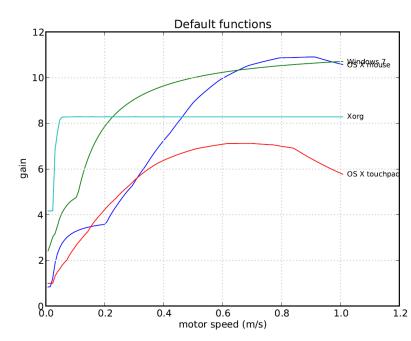

Figure 9: Default functions used by Windows 7, OS X 10.6.7 (mouse and touchpad) and Xorg.

Training a Mouse Transfer Function using Reinforcement Learning

(Niels)

- Step 1: Generate an Initial Dataset
 - Implement an target selection apparatus (hitting circles with a mouse)
 - Ask participants to select targets using different transfer functions
- Step 2: Setup an Reinforcement Learning Environment
 - Combine recent progress in reinforcement learning
 - Actor-critic with continuous action + state space
 - Experience replay [1]
 - Simulating (dreaming about) the user [2]
 - Initialization using existing transfer functions and initial dataset
- Step 3: Reinforcement Learning with Humans in the Loop
 - Conduct a study where a transfer function is learned while participants select targets
 - Compare learned function with existing one
